

Developing Sport Expertise

Researchers and Coaches Put
Theory into Practice

Third Edition

Edited by Damian Farrow, Joseph Baker and Clare MacMahon

Developing Sport Expertise

The athlete development process spans from initial sport engagement to elite-level performance to effective career transition out of sport. This is a long and complicated process. Identifying and nurturing talent, fine-tuning sport skills, and maintaining high levels of performance over the course of a career requires many thousands of hours of training and, increasingly, the input and support of expert coaches and sport scientists.

In this fully revised and updated new edition of the leading student and researcher overview of the development of sport expertise, a team of world-class sport scientists and professional coaches examine the fundamental science of skill acquisition and explore the methods by which science can be applied in the real-world context of sport performance.

This book surveys the very latest research in skill acquisition, provides a comprehensive and accessible review of core theory and key concepts, and includes an innovative “Coach’s Corner” feature in each chapter, in which leading coaches offer insights from elite sport and critique contemporary practice in sport skill development. The third edition of *Developing Sport Expertise* will be invaluable reading for all researchers and students in the areas of expertise in sport, skill acquisition, motor control and development, sport psychology, or coaching theory and practice.

Damian Farrow is the Umpiring Coaching & Innovation Manager for the Australian Football League. He is also Professor of Skill Acquisition at the Institute of Health and Sport, Victoria University, Australia. His current roles are typical of Damian’s career, being situated both in the high-performance sports industry and academia. His research and practical interests centre on the development of sport expertise with a particular focus on practice methodology and decision-making skills. Damian is the author/editor of seven books and over 150 peer-reviewed articles and book chapters.

Joseph Baker is Professor and Tanenbaum Chair in Sport Science, Data Modelling and Sport Analytics in the Faculty of Kinesiology and Physical Education at the University of Toronto, Canada. He has also held visiting researcher/professor positions at the Carnegie Research Institute at Leeds Metropolitan University in the United Kingdom, Victoria University and the Australian Institute of Sport in Australia, and the Institute of Sport Science at Westfälische Wilhelms-Universität Münster in Germany. His research considers the varying influences on optimal human development, ranging from issues affecting athlete development and skill acquisition to barriers and facilitators of successful aging. Joe is Past President of the Canadian Society for Psychomotor Learning and Sport Psychology and the author/editor of 12 books and over 200 peer-reviewed articles and book chapters.

Clare MacMahon is an Associate Professor at La Trobe University in Melbourne, Australia. With a particular focus on talent development in sport and expertise in sports officiating, Clare’s research brings together cognitive psychology and human movement. Clare is active in skill acquisition in Australia and internationally, having co-established the Australasian Skill Acquisition Network, which brings together researchers and practitioners, and as the Oceania representative for Sport Psychology to the International Association of Applied Psychology.

Contents

<i>List of illustrations</i>	vii
<i>List of contributors</i>	x
<i>Preface</i>	xvii
1 A very brief introduction to Applied Sport Expertise DAMIAN FARROW, JOE BAKER AND CLARE MACMAHON	1
2 Sowing the seeds of success: Specialization, diversification, and early athlete training JOE BAKER, GILLIAN RAMSAY AND ALEXANDRA MOSHER	6
3 The Athletic Skills Model as a foundation for the development of expertise: Creating challenging environments GEERT J. P. SAVELSBERGH AND RENE WORMHOUDT	15
4 Coaching for creativity VERONIQUE RICHARD AND DARREN HOLDER	27
5 Predicting athletes' futures: A necessity with little scientific basis TILL KOOPMANN, KATHRYN JOHNSTON, ALEX ROBERTS AND JÖRG SCHORER	39
6 The expert sports official in research and practice CLARE MACMAHON, TAMMIE VAN BIEMEN, HENNING PLESSNER AND ALEXANDRA PIZZERA	47
7 Developing the expert performance coach MARK W. BRUNER, COLIN MCLAREN, RACHEL VAN WOEZIK AND JEAN CÔTÉ	58
8 Evaluating coaching expertise CHRIS CUSHION	70
9 Technology supported coaching DAMIAN FARROW, PETER LE NOURY AND OLIVIA CANT	80
10 Self-regulated learning in sport practice: Agency, assessment, and actioning BRADLEY W. YOUNG, LISA BAIN AND JOSEPH BAKER	90

vi *Contents*

11	Data informed practice	100
	TIM BUSZARD AND SAM ROBERTSON	
12	Perception and pressure: Research and implications	110
	MARK R. WILSON, SAMUEL J. VINE, TOM ARTHUR AND DAVID J. HARRIS	
13	Play with and against!: Insights for the development of decision-making in team sports	122
	PEDRO PASSOS	
14	Developing technical skill expertise	133
	GEORGIA GIBLIN, DAVID WHITESIDE AND MACHAR REID	
15	Female sport expertise through a skill acquisition lens: A key future direction	143
	CLARE MACMAHON, ANTHEA CLARKE, ALANA LEABEATER AND ALEX ROBERTS	
	<i>Index</i>	154

Illustrations

Figures

2.1	A simple schematic of early engagement patterns in youth sport.	11
3.1	The Fundamental 10	18
3.2	The ASM Movement Continuum is used to analyse one sport in relation to 10 basic movement skills. The circles, Specific, Adaptive, and Donor involve specific basic movement skills, the multi-circle involves non-specific basic movement skills, which are not in your main sport, game, or task.	19
3.3a and b	The Athletic Skills Track at Football Club Ajax Amsterdam, designed by Athletic Skills Model and built in 2012.	22
3.4	The Skill Garden.	23
3.5	Environment at Academy of Physical Education Amsterdam.	24
4.1	The creative potential system.	31
4.2	Coaching for creativity: A summary of what, why and how.	32
6.1	Classification system for sports officials.	48
6.2	Decision flow model of game managers for errors. Results of evaluation process can be either correct or result in an error which requires compensation.	49
6.3	The position of the assistant referee ahead of the offside line results in a perceptual error. The offender is perceived ahead of the second-last defender and thus offside, but actually is in line with the defender and thus onside. The perceptual error could result in a flag error.	50
6.4	Different communicative management styles for refereeing with examples from association football.	53
7.1	Stages of high-performance coach development.	67
9.1	The kinematic capture of a tennis player performing a forehand groundstroke.	81
9.2	A virtual opponent performing a serving action that produces a real-world ball trajectory which can be used inside an animated VR tennis environment.	81
10.1	The Self-Regulated Sport Practice Cycle of metacognitive processes and motivational processes.	91

10.2	Distributions of perceived self-organized time from 0 to 100% of all the activities that athletes engage in to prepare for their sport, for individual sport athletes (at left) and team sport (right) athletes. Note. Each bar represents a bin of 5 percentage points in width. Dotted lines indicate the mean percentage of perceived self-organized time by sport type.	94
10.3	The Co-regulatory Coaching Interface Model.	97
11.1	Overview of key decisions in practice design.	101
11.2	Example of how analytics can improve the measurement of representative learning design. The rule frequency shows how often the athlete experiences the conditions in practice or competition, which can be considered alongside how likely they are to produce a given response (i.e., an effective pass).	103
12.1	Schematic representation of the bi-directional pressure-performance relationship.	111
12.2	Modern pentathletes performed laser pistol shots before and after running (low/high fatigue) and during training and selection camps (low/high pressure). The quiet eye duration (a measure of focus on the target) of the athlete in the left panel was disrupted by pressure and not by fatigue, whereas the one on the right was more affected by fatigue than pressure.	113
12.3	The probability that an error occurred on an offensive play (fumble, incomplete pass, sack, interception) as a function of pressure score (higher = more pressure) and the outcome of the previous play. It is evident that errors were more likely after a preceding error and as pressure increased. The interaction effect showed that the effect of a preceding error on performance was more apparent under high-pressure plays (late in the game, in the red zone, when scores are close, on 4th down etc.).	115
12.4	The probability that an unforced error occurred on a point was higher as pressure increased (Panel A) and as a function of whether an unforced error had been committed on the preceding point (Panel B). There was no effect of pressure or preceding shot outcome on the probability of a winner (an unreturnable shot) (Panel C).	115
12.5	The present is where the power is. The past cannot be changed and the future cannot be determined. We have discussed how past errors (related to perceptions of the probability of failure) and thinking about the importance of future consequences (related to perceptions of cost of failure) can impair performance. The key is to pull focus back to the “now”.	118
13.1	The inverted-U hypothesis for the synergies–performance relation. The best performance is achieved on the mid-level of synergies “stiffness”.	124

13.2	A behavioural methodological proposal. Levels of representativeness: (1) soft interaction, no interaction, or passive interaction among opponents; (2) medium interaction, minor contact is allowed and the possibility of recovering ball possession is open; (3) full interaction, all the possibilities of action are open (similar to a competitive match situation). The numbers 1, 2, and 3 identify the three levels of the methodological proposal: 1. Improve the perception and action attunement; 2. Increase the speed of decision-making; 3. Increase decision-making accuracy.	127
14.1	An example of some of the key attributes of a tennis racquet that a tennis player can now customize to their performance needs with an individualized fitting service.	137

Tables

1.1	Key issues coaches and scientists identify in collaborations: Improving coach and scientist interactions.	2
7.1	Comparing Rankings of Actual Versus Preferred Sources of Coaching Knowledge.	65
8.1	Framework of Factors to Evaluate Expertise.	76
8.2	Eisenhower's decision-making matrix.	78
9.1	Examples of the different sensor options and measures available.	84

Preface

The impetus for the first edition of this text came from an applied workshop convened by the three of us at the Australian Institute of Sport (AIS) in 2005. This meeting brought together coaches, athletes, researchers, and applied sports scientists to share information under the banner of Applied Sport Expertise and Learning. To this day it has been one of the most impactful two-day workshops each of us have ever attended. The unique circumstance where many of the world's foremost academic minds in Sport Expertise were able to attend the AIS and share ideas with elite Australian coaches from a wide variety of sports was unparalleled at that time. The researchers at this workshop were asked to consider the following questions when preparing their presentations:

- 1 What does your research tell us about the development of talented/elite athletes, coaches, and officials?
- 2 How can the information from your research be used to optimize training and performance?
- 3 Do your research findings have any application to talent identification programs?

It is now 16 years since the publication of the first edition of *Developing Sport Expertise: Researchers and Coaches Put Theory into Practice* in 2007 and a decade since the second edition. Not surprisingly there has been substantial progress made both theoretically and practically in regards to many of the domains examined in the text. Technology has continued to evolve such that testing, measurement, and training approaches not possible in 2007 and 2013 are now mainstream. Many countries continue to invest significantly in the development of their sporting talent in the search for more Olympic Gold, through talent identification and development systems. Similarly, professional sports have “discovered” Sport Expertise, and, pleasingly, there are now more roles in the underpinning fields of Skill Acquisition, Sport Psychology, and Talent Development than ever before as teams try to find a competitive edge. Public interest in expertise, and more specifically Sport Expertise, piqued around the time of the second edition of the text and that interest hasn't waned. There has been a regular procession of popular psychology books starting with Malcolm Gladwell's *Outliers* and Dan Coyle's *Talent Code* through to more recent publications such as *The Best* by Mark Williams and Tim Wigmore, and *The Tyranny of Talent* by Joe Baker (one of the editors of the book you're currently reading). If you are not reading about Sport Expertise, chances are you are listening to a podcast about it!

Given this context, the purpose of this edition has not altered substantially compared to previous editions. This third edition serves to fill a gap in the available literature

that presents accessible theory and practical recommendations from the experts producing the research and actually working in this exciting domain. In filling this gap, we have updated chapters from the first and second editions and added some new chapters. As a result, the current edition represents a summary of the issues in Applied Sport Expertise Research that have particular relevance at the present time.

As with previous editions, the third edition of this book is quite different from other texts on Sport Expertise. In the current text, the researchers have presented their work in a manner that is applicable and accessible not only to scientists, but also to administrators and sport managers, coaches, and athletes. Again, current top-level coaches have reviewed and commented on the researchers' findings (see the Coach's Corner segment of each chapter), and present real-world application of the concepts discussed. These coaches have been drawn from around the world and represent some of the finest experts working in professional sport, Olympic sport, and talent development today. They work with a variety of sports and athletes at developmental, sub-elite, and professional or Olympic levels.

Given the focus on marrying research and application, this book is designed for the progressive coach and/or athlete who is motivated to adjust their coaching or training programs so that they are making the most out of current research on optimal training and development. It examines sport skill on a macro level, understanding some of the pre-cursors underpinning the development of Sport Expertise, sport development systems, talent, and programming, as well as a micro level, addressing contemporary issues around coach development, the design of training, use of technology, and the development of all facets of expert sport performance.

We hope you enjoy the book. As always, it would not be possible without the efforts of the researchers and coaches whose high-quality work is captured in this text.

Damian Farrow, Joe Baker, and Clare MacMahon
