

ROUTLEDGE ADVANCES IN EUROPEAN POLITICS

Sustainable Development and Governance in Europe

The evolution of the discourse on sustainability

Edited by
Pamela M. Barnes and
Thomas C. Hoerber

Sustainable Development and Governance in Europe

This book analyses the evolution of the sustainability discourse in the European Union, exploring the conditions necessary for sustainable development to move from a conceptual model to a model for action for strategic decision makers at all levels of governance.

This book questions the extent to which the discourse on sustainability has become embedded into governance structures in Europe. It focuses on the importance of the nature of the language of the political discourse on sustainability and how ideas are communicated amongst the actors and stakeholders in the policy making process, as well as assessing the conceptual, political, institutional and operational barriers apparent across the European geographic region. Drawing case studies from numerous policy areas – including climate change, EU emissions trading schemes, renewable energy, nuclear energy, the European integrated energy market, transport mobility and environmental protection – expert contributors unveil a narrowing of the discourse on sustainability that has taken place in Europe. However, a considerable discontinuity remains between the economic and environmental objectives of sustainable development, and the authors argue that it is essential that conditions for a dynamic discourse, open to multiple participants, are maintained.

Sustainable Development and Governance in Europe will be of strong interest to students and scholars of comparative politics, governance, sustainable development, and environmental politics and studies.

Pamela M. Barnes, Jean Monnet Chair ‘ad personam’ in European Political Integration; Research Associate at the Centre for European Integration at ESSCA School of Management, LUNAM University, Angers, France.

Thomas C. Hoerber, Associate Professor at the Centre for European Integration at ESSCA School of Management, LUNAM University, Angers, France.

Editors' preface

This book includes contributions from an international and multidisciplinary research network formed to analyse the evolution of the discourse on sustainability in Europe. The Governance for Sustainability in Europe research network was established with support from the University Association for Contemporary European Studies (UACES), and was co-financed by Ecole Supérieure des Sciences Commerciales d'Angers (ESSCA) Graduate School of Management, Angers, France and the Universities of Leeds and Bradford, UK. The network includes more than 50 international contributors. They are drawn from the academic community, policy makers, policy implementers and practitioners. All have research expertise in various aspects of environmental policy in Europe, in both theoretical and applied contexts.

The conveners of the network were:

- Dr Jenny Fairbrass, Senior Lecturer in Strategy, Head of the Strategy, Economics and International Business group, University of Bradford, UK.
- Dr Thomas Hoerber, Associate Professor, ESSCA Graduate School of Management, Angers, France.
- Dr Simon Lightfoot, Senior Lecturer in European Politics, POLIS Director of Learning and Teaching, University of Leeds, UK.

The research included in this volume was presented during a series of research workshops held by the members of the network at the universities of Bradford (2009), Leeds (2010), ESSCA, Angers (2011) and Trinity Hall, University of Cambridge (2012). The diversity of the disciplines and interests of the research network has provided an opportunity for wide-ranging exchange of views and ideas about the evolution of the political discourse on sustainability in Europe. Furthermore, it has enabled the members of the research network to analyse the conditions necessary for sustainable development to move from a conceptual model into a structure for long-term strategic action by decision makers at all levels of governance. The case studies in this volume are drawn from supranational, national and sub-national levels of governance, in contrast to other volumes which adopt an approach based on cases from the supranational and national levels or focus solely on the sub-national. Although national cases are included in the volume, the authors have not focused on discrete country-by-country analyses, but have adopted a thematic approach.

Acknowledgements

The editors wish to thank ESSCA Graduate School of Management, Angers, France, for the generous financial help and support they have provided during the compilation of this volume. Our special thanks go to Professor Jacques Boulay (Director of Research and School Developments, ESSCA) and Professor Albrecht Sonntag (Scientific Director of the Centre for European Integration, ESSCA) for their encouragement to proceed with the book, and to Ms Aline Brisset (Administrator, International Affairs Department/Centre for European Integration, ESSCA) for her help and support in organizing workshops and meetings.

Our thanks also go to the University Association for Contemporary European Studies (UACES) which provided the financial support to form the Collaborative Research Network (CRN), of which we are all members, and to the European Co-operation in Science and Technology (COST) Research Network on the Transformation of Global Environmental Governance: risks and opportunities (TGEG) and Trinity Hall, Cambridge, for providing funding for our workshop in Cambridge, 2012.

We send thanks to Heidi Bagtazo, Routledge, for her advice and support and to Alexander Quayle, Routledge, for his patience, tolerance and good humoured responses to even the most trivial of our questions. Thanks also go to our copy editor, Helen Belgian Cooper and Amy Ekins, Wearset.

Finally, but most important of all, we would like to thank all the contributors to this volume who have worked so hard to meet the deadlines which we imposed upon them.

Introduction

Establishing the research questions and methodological framework

Pamela M. Barnes and Thomas C. Hoerber

Research themes and questions

Dryzek, in his analysis of the development of the environmental discourse of the 1950s and 1960s, highlighted the hegemonic position in the political discourse of the concept of 'industrialism'. He characterized industrialism 'in terms of its overarching commitment to growth in the quantity of goods and services and to the material well-being that growth brings' (Dryzek 2005: 13, 2nd edition). As the single dominant discourse of the period, industrialism conditioned not only the agreement of its proponents with the concept's central tenets, but also the development of any opposing viewpoint. The opposing view which Dryzek saw emerging during the 1950s and 1960s was couched in terms of a discourse of sustainability (Dryzek 2005: 22).

However, a pre-occupation with the challenges of sustainability was not completely new in the 1950s. It had origins in debates which had taken place for generations about the potential of the ecosystem to subsist over time. But for many in the 1950s and 1960s the sustainability discourse had a limited focus, primarily upon ecological sustainability, which led Pearce to later conclude that a sustainable future 'may well be awful', unless certain conditions were met, specifically that both inputs and outputs were sustained and social goals other than Gross Domestic Product (GDP) growth were embraced (Pearce 1993: 5). Sustainable development, by incorporating economic sustainability with ecological sustainability, significantly altered the political discourse about how economic and environmental objectives should become linked in policy decision making. The conceptual model of sustainable development was based on the idea that economic growth and environmental protection were interdependent and should not be perceived in isolation one from another.

Sustainable development emerged as a significant element of political debate throughout Europe following the publication of the report of the World Commission on Environment and Development (WCED) (the Brundtland Report) in 1987. The report highlighted the problems of increasing environmental damage and degradation which accompanied high levels of consumption of natural resources in the industrialized world. The objective set in the Brundtland Report was to establish patterns of development which would be sustainable for all and result in better life quality for current and future generations. (See Figure I.1).

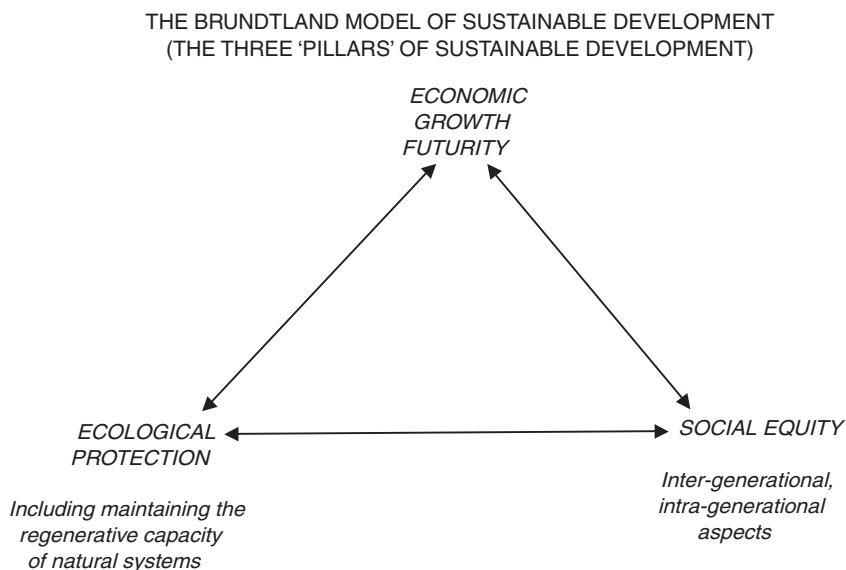

Figure 1.1 The Brundtland model of sustainable development (the three 'pillars' of sustainable development).

As it developed, in the 1980s the discourse on sustainable development encapsulated a more optimistic element than the hegemonic environmental discourse of the 1960s, in which the only alternative to curb the demands being placed on the environment was to introduce draconian action imposing constraints on the model of economic development which had taken hold in the industrialized world.

Since the 1980s the concept of sustainable development has become the 'accepted wisdom' of the discourse amongst institutional actors and non-institutional stakeholders at all stages of the policy cycle. As a conceptual model it encompasses complex changes in society in order to achieve the ends of economic development, environmental protection and social justice. Whilst evidence suggests that changes towards a sustainable society are taking place in Europe, there is also considerable evidence to suggest that there are still many issues where the necessary changes to behaviour have not been made. Baker highlighted the difficulties of promoting sustainable development 'amidst a profound lack of knowledge about the complex and dynamic interactions between society, economic development, technology and nature' (Baker ESEE 2009).

The editors and contributors to this volume, all members of the University Association for Contemporary European Studies (UACES) Collaborative Research Network on Sustainability, have turned their attention to a trend which has emerged in the literature of the discourse on sustainability, which analyses

the linkage of the two conceptual models of sustainable development and governance (Lafferty 2004; Baker 2010). The objective of their research was to evaluate the extent to which the conceptual model of sustainable development has become the model for action in formal and informal governance structures in Europe. It was not the intention of the research network to impose limitations on its members with regard to the theoretical approach, the nature of the case studies or the governance structures they analysed; indeed, the objective was the very opposite. The research network sought to bring together an extensive group of academics, policy makers and practitioners from differing disciplinary backgrounds in order to engage in wide-ranging debate about sustainability in Europe.

Three thematic strands were identified around which the deliberations of the research network coalesced. The first of these was the theme of sustainability, focusing on the differing discourses which manifest around the concept of sustainability and looking at the ways in which language, lexicons and systems of classification can construct meanings within different social contexts and affect the formation of value meanings. Crucially, a political logic is evident as the term 'sustainability' is used by a wide variety of actors to rationalize action and develop proposals. Two questions were posed for analysis in this thematic strand: first, how have policy makers translated sustainability into economic, social and environmental principles; and, second, how are these 'operationalized' via human institutions that participate in the governance of sustainability where the public, private and voluntary sectors are the key actors?

The second theme concentrated on recent developments in the discourse, analysing the ways in which 'environmental' concerns are being extended into 'traditional' energy policy areas such as those relating to European gas and electricity networks, transport fuel, and the generation of nuclear electricity. The third theme questioned the extent to which an 'environmental conscience' has developed in Europe. The concept of an 'environmental conscience' refers to a 'deep green world view', which arguably sets the boundaries of 'green' policies. The research within this theme explored how the nature of a moral obligation towards the environment has varied over time. Shifts in the discourse defining the term 'environment' were identified, from a passive sense of 'surroundings' to an active sense of 'protection' once environmental degradation came to be viewed as a threat to the 'normal' conduct of human life.

However what quickly became apparent was that a number of underlying themes were present in the analysis being carried out within the research network, including:

- 1 The importance of the nature of the language of the political discourse on sustainability.
- 2 The process by which ideas are communicated amongst the actors and stakeholders in the policy and decision making processes.
- 3 The process which takes place as the discourse becomes embedded in governance structures at all levels.

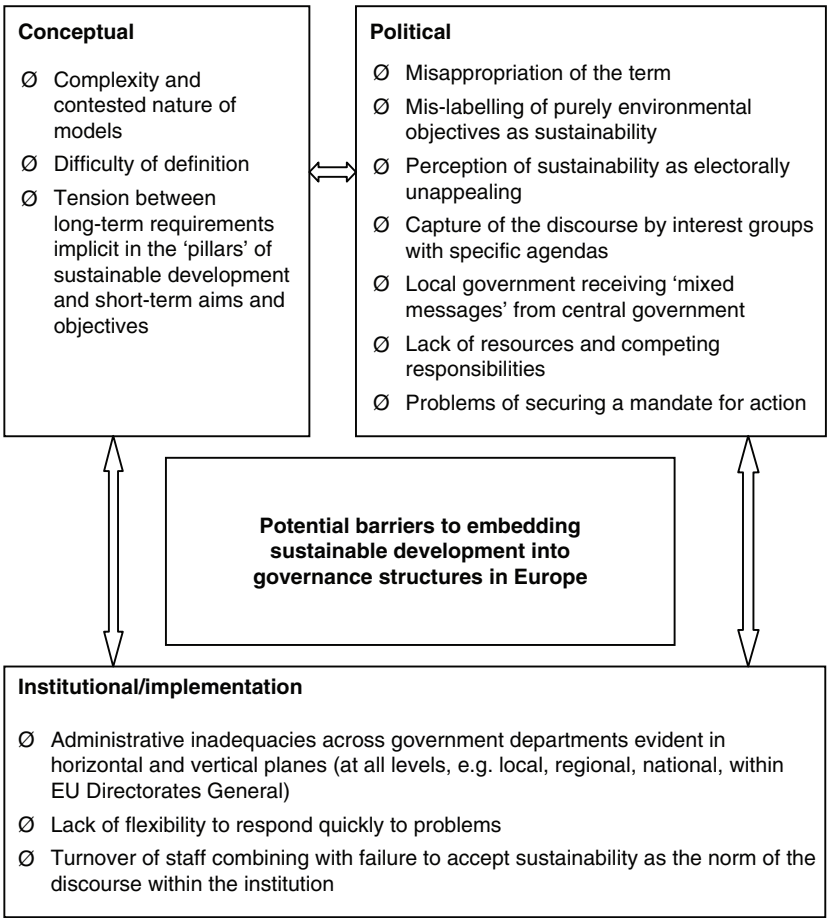

Figure I.2 Typology of potential barriers to embedding sustainable development into governance structures in Europe.

The evidence from the chapters highlighted a failure to establish common ideas and referents in the discourse as the core of the difficulties in establishing effective policies for sustainable development in Europe. This failure to establish a discourse based on common ideas and referents in turn undermines the development of governance structures to steer progress towards sustainability. It is argued in this volume that in order to achieve the linkage of sustainable development and governance, communication and acceptance of political ideas, resulting in the development of agreed norms and codes of conduct, are of vital importance.

As a result of the deliberations during the various workshops held by the research network two research questions emerged, which have formed the basis of this book:
