Preface

In 1998 in the Czech Republic the Scientific and Technical Association for Building Rehabilitation and Monument Preservation was established as a regional group of WTA e.V. using the abbreviation WTA CZ. The association has held a national conference with international participation every year under the patronage of experts from research and development institutions devoted to the field of structural rehabilitation. The 16th Conference on the Rehabilitation and Reconstruction of Buildings, again featuring international participation, within which new trends and procedures in the field of building rehabilitation were discussed at the international level. The transfer of experience with the rehabilitation of structures and of knowledge regarding the behaviour of materials or the efficiency of methods used in this field is the main benefit for participants in this international conference. In addition, through personal participation authors are able to establish professional cooperation with other participants for their further work or scientific development.

The 16th International Conference on Rehabilitation and Reconstruction of Buildings – CRRB 2014 was held on 5th and 6th of November 2014 in Brno. The conference was hosted by dean of the Faculty of Civil Engineering of Brno University of Technology, Professor Rostislav Drochytka. Conference attended more than 90 participants from six European countries, except for Czech Republic including Slovakia, Germany, Ukraine, Russia and Bulgarian. The conference schedule for the first day was comprised from oral presentations of conference contributions which were divided into seven thematic sections. The next day, the conference program continued with a multilateral discussion on contributions presented in the poster session.

We have to thank all the members of organizing committee for covering the fluent run of the conference, additionally to thank all the members of scientific committee for their professional chairman leading of every speaking sections of the conference program, moreover for their revisions of each contribution to complete peer-reviewed proceedings. Finally, special thanks belongs to all participants, who prepared high quality speeches, presentations and posters, and to guests presenting invited lectures.

On behalf of conference organizers and hosts, we would like to invite all the participants to the next 17th CRRB, which will be held in November 2015 in Prague.

Table of Contents

Preface and Committees

Chapter 1: Protection and Remediation of Wood Structures

Application of Colored Impregnating Glazes on Wood and Color Changes due to Artificial Aging S. Slunská	3
Research of Fire-Retardant Properties of Timber Constructions, Protected Geocement-Based Coating, after their Operation A. Kravchenko, S. Guzii, Y. Tsapko and V. Petranek	7
Heat-Reflecting Geocement Based Coatings Containing Perlite for Fire Protection of Timber S. Guzii, A. Kravchenko, P. Kryvenko, Y. Tsapko and K. Sotiriadis	11
Mineralization Influence on the Strength Parameter of Solid Wood T. Murínová, P. Mec, J. Daňková and P. Rezek	15
Reconstruction of Historical Timber Roofs at Zehusice Castle R. Zidek, A. Utíkal, I. Utíkalová, L. Brdečko and H. Brdečková	19
Wooden Facade with Bonded Joints - Experimental Test B. Nečasová, P. Liška and J. Šlanhof	23

Chapter 2: Surface Treatment

Determination of Compressive Strength of Cement and Polymer-Modified Cement Pastes with Pozzolans N. Žižková and P. Bayer	31
Development of Thermal Insulation, Capillary Active Plasters Suitable for Historical Buildings J. Hroudová, J. Zach and M. Sedlmajer	35
Formation of Efflorescence on the Surface of Construction Products in the Process of their Operation G. Yakovlev, A. Politaeva, A. Shaybadullina, A. Gordina and A. Buryanov	39
<i>In Situ</i> Applicability of Selected Nanotextiles on Surfaces of Historic Plasters M. Šmidtová and K. Kroftová	44

Chapter 3: Restoration of Stone

Remediation of Old Sandstone Structures via Hydroinsulating Injection Gels J. Melichar, R. Drochytka and P. Dohnálek	51
The Effect of the Flood in 2002 on Microflora of the Sandstone Blocks of Charles Bridge in Prague R. Wasserbauer, E. Burgetová and Z. Rácová	55

Chapter 4: Redevelopment of Masonry

A Survey of Historic Galleries in the Area of the Prague Castle E. Burgetová and K. Michalová	61
Drying Technologies in Masonry Structures M. Novotný, K. Šuhajda, J. Sobotka and Z. Jiroušek	65
Possibilities of Hydrophobization of Masonry Construction for High Risk Flood Areas J. Zach, J. Hroudová, M. Sedlmajer, V. Novák and M. Reif	70
Protecting the Brickworks against Technical Seismicity J. Solář	74

Special Mortars for Repair Masonry: The Problem of the Optimization A. Kharitonov and O. Smirnova	78
The Application of Carbon Composites in the Rehabilitation of Historic Vaults J. Witzany, J. Brožovský, T. Čejka, K. Kroftová, V. Maršík and R. Zigler	82

Chapter 5: Redevelopment of Concrete Structures

Determining the Presence of the Corrosion Inhibitors Based on Amines in Hardened Mortars M. Fiedlerová, L. Taranza, R. Drochytka and M. Tupý	93
Development of Repair Mortars Based on Alkali Activated Materials for Application in Chemically Aggressive Surroundings Á. Dufka, J. Brožovský and T. Melichar	98
Fine Grain Portland Cement Concrete with Complex Nanodisperse Admixture for Structure Rehabilitating G.D. Fedorova, G.N. Alexandrov, G.I. Yakovlev, I.S. Polyanskikh and I.A. Pudov	105
Influence of Temperature on Structure Formation Processes Geocements for Rehabilitation of Concrete V. Kyrychok, R. Drochytka and P. Kryvenko	111
Reconstruction of the Municipal Bath House R. Cajka and K. Burkovic	115
Shielding Silicate Composition of Increased Durability for Repair and Rehabilitation A. Shaybadullina, A. Politaeva, G. Yakovlev and G. Pervushin	121
Special Repair Materials and Influence of Aggressive Environment on their Properties L. Mészárosóvá, E. Tűmová, Á. Dufka and R. Drochytka	127
The Suitability of Sealants for Use with Concrete Structures J. Šlanhof, P. Liška, B. Nečasová and M. Šimáčkóvá	131
Development of Lightweight Repair Materials Applicable to Re-Profiling to the Lightweight Concrete Š. Keprdová, J. Bydžovský and N. Žižková	135

Chapter 6: Materials Properties and Measurements in Building

Comparison of Standardized Test Methods for Determining the Permeability of the Surface Layer of Concrete T. Komárková, M. Králíková, D. Kocáb, P. Misák and T. Stavař	141
Enhancing the Wood Glue Bond Using Cellulose Modified Epoxy J. Vaněrek, R. Drochytka and A. Benešová	145
Experimental Comparison of Air Pore Content of Concrete with Different Dosage of Cement by Microscopic Analysis B. Moravcová, M. Blažek, P. Pössl and P. Misák	149
Experimental Determination of Innovative Plaster Moisture Expansion J. Lukovičová, G. Pavlendová and S. Unčík	153
Influence of Firing Temperature on the Quality of Fly Ash Body V. Cerný	157
Investigating Interior Changes in Historical Building by Computational Modeling and Determination Critical Places for Structural Conservation J. Souček and P. Tichá	161
Long-Term Durability of Modified Wood-Polymer Composite to Alternate the Solid Wood External Application A. Benešová and J. Vaněrek	165
Microscopic Analysis of Degradation of Polymer Fibers Subjected to Aggressive Environment M. Kostecká, D. Kytýř, V. Petráňová and P. Koudelka	169
Non-Destructive Defectoscopy of Building Structures by Lock-In Thermography Z. Peřina, R. Fabian, M. Wolfóvá, P. Valíček and V. Panovec	173

Non-Destructive Defectoscopy of Building Structures by Pulsed Thermography Z. Peřina, R. Fabian, M. Wolfová, P. Valíček and V. Panovec	177
Selection of Alternative Additives and their Influence on High-Temperature Resistance of Repair Mortars M. Fiedlerová, T. Melichar, J. Bydžovský and Á. Dufka	181
Single-Sided Nuclear Magnetic Resonance as a Non-Invasive Tool to Evaluate Sprayed Polymer Concrete R. Schulte Holthausen and O. Weichold	185
Storage Properties of Water-Soluble Salts in Bastion Historical Brick R. Pernicová	191
Thermographical Measurement of the Surface Temperature and Emissivity of Glossy Materials Using the Method of Four Points F. Čmiel and J. Solař	195
The Effect of Long Term Storage on Properties and Stability of Dry Mixture E. Tůmová, L. Mészárosová and R. Drochytka	201
The Thermographic Measuring of the Surface Temperature of the Peripheral Wall after Removing a Technical Device for Elimination of Reflected Radiation J. Solař and F. Čmiel	205
Thermally-Technical Comparing of Traditional Double Timber Window and Eurowindow L. Balík and L. Kudrnáčová	210
Thermotechnical Calculation of Air Cavities by Rehabilitation of Wet Brickworks J. Solař	214
Use of Glassy Slag from Biomass Combustion in the Building Industry – Coarse Aggregate F. Khestl, V. Šulková and P. Mec	219
Use of Separated Dust from the Formatting and Grinding Cement-Bonded Chipboards to Modify their Composition T. Melichar, D. Konečný, J. Bydžovský and M. Vacula	225
Utilization of Liquefying Additives in Clay Fly Ash Grouting Mixtures E. Helanová, M. Kociánová and R. Drochytka	229
Verification of Applicability of Alternate Sources of Heat for Determination of the Surface Temperature and Emissivity of Glossy Materials F. Čmiel and J. Solař	233
Verification of Applicability of Thermographical Measuring of the Surface Temperature and the Influence of Emissivity of Glossy Materials while Eliminating the Reflected Radiation Using a Metal Shield J. Solař and F. Čmiel	237

Chapter 7: Static and Dynamic Analysis of Buildings and Constructions

Comparison of Two Medieval Trusses from the Viewpoint of Geometric and Static Analysis P. Krušínský, E. Capková and J. Gocál	243
Statistical Simulation of Accidental Loads in the Problems of Constructional Mechanics B. Yermenko, A. Pashko and S. Terenchuk	249
Factors Affecting the Accuracy of Computations of Historic Structures A. Maroušková	253
Flexural Buckling of Columns Strengthened under Load M. Vild and M. Bajer	257
Insufficient Maintenance an Achilles Heel of the Broumov Group of Churches G. Facelli and P. Kuklik	261
Longitudinal Shear Analysis of Composite Slabs with Prepressed Embossments J. Holomek, M. Bajer and M. Vild	265
Numerical Investigation of Reinforcing a Masonry Column with Fiber Reinforced Strain Hardening Cementitious Composite M. Jašek and J. Brožovský	269
The Corner Radius Influence on the Deformation Behavior of Brick Pillars Strengthened by CFRP Confinement J. Kubát and J. Karas	273

The Shear Strength of Epoxy Adhesive Used for Chemical Anchors
J. Barnat and M. Bajer

CHAPTER 1:

Protection and Remediation of Wood Structures

Application of Colored Impregnating Glazes on Wood And Color Changes due to Artificial Aging

SLUNSKÁ Sylvie^{1, a*}

¹VŠB - Technical University of Ostrava , Faculty of Civil Engineering, Czech Republic

Keywords: Xenontest, colorchanges, wood, impregnation, artificial aging

Abstract. Wood as organic material is extremely stressed and its surface may be damaged over time due to atmospheric effects, mainly due to solar radiation and exposure to water. The purpose of this experiment is to compare colour changes of selected impregnation stain the wood, which in practice is primarily used for facade systems. These are among some of the most stressed parts of the building and construction, they must be paid great attention. Wood samples were painted with a colour glaze impregnation and subsequently subjected to artificial aging. The results show that the type of selected species, but also finish before applying a waterproofing glaze can affect subsequent changes light fastness, whether it is a lightening or darkening.

Introduction

Wood is very good absorbent of sun light. This material can absorb not only one type of light but can absorb electromagnetic radiation and this way a photochemical reactions are created, which lead to its change of colours [1]. The ultraviolet radiation destroys lignin and other components in exterior conditions, which are under the influence of rain, drifted out and causes the loss of colour [2]. These conditions lead to an attack of wood by wood-destroying fungi, cumulating of filth and not least to the loss of natural wood colour [3]. The aim of this experiment is to judge the colour change of impregnation stains applied in three different stains (painting systems) on the chosen kinds of wood for prediction of light intensity in relation with time of artificial ageing with the help of Xenotest Q-Sun Xe-1, which simulates an outside environment UV radiation, by the change of temperature and rain of distilled water.

Material and methods - Samples

For experiments we choose pine wood. The samples were with dimensions 45×40×8 mm (L×R×T) for the artificial aging test device Xenotest chamber Q-Sun Xe-1 modified according to standard EN 927-6. The samples are with no cracks, knots and without sources of resin. After choosing the correct samples we place them in a climate chamber with relative humidity 65 ± 5 % and temperature 20 ± 2 °C. The equilibrium moisture content after conditioning was 12 ± 2 % according to standard STN ISO 554. A combination of coatings is listed in Table 1.

Table 1. Combination of paints used

Samples	PB(G)1	PB(G)2	PB(G)3	PB(G)9	PB(G)10	PB(G)11
Number of coats	1	2	3	1	2	3
Sanding between coats of paint with sandpaper 240	NO	NO	NO	YES	YES	YES
Sample roughened with sandpaper before painting 100	NO	NO	NO	YES	YES	YES

The pine surface was treated with impregnation glaze. We used for experiment two types of paint from the same manufacturer, but in two colours - green and brown. Samples labelled PB(G)9, PB(G)10 and PB(G)11 between coats sanded 240 grit sandpaper to achieve better adhesion disruption of the surface species and the greater receipt.

The aging of samples

The samples for experiment were aged in Xenotest chamber according the modified standard EN 927-6 [4]. Accelerated aging was carried out in Xenotest Q-SUN Xe-1-S (Q-Lab Corporation, USA) with a xenon lamp 1800 W of power, which can simulate not only sunlight but also can simulate rain, spray of distilled water. The lamp operates in a Xenotest with radiation UVA - 340 nm and a temperature which is determined according to standard EN 927-6. Aging in Xenotest chamber took place in two week cycles. Weekly i.e. 168 hours cycle was divided into phases A – C. The first phase lasted 24 hours and the samples were only exposed to a temperature of 45 ± 3 °C. Avoid water stress or UV radiation. The second phase B 2.5 hours at 50 ± 3 °C, the water spray is turned off and the sample acts UV radiation in the table. After 2.5 hours, turns on the water spray and UV contrast off. The test is conducted in the dark. The temperature drops to 20 ± 1 °C and for 0.5 hours operating on samples of distilled water only. Last 48 hour cycle C is a combination of the second step [4]. According to Hon [5], it was found that the water helps the penetration of electromagnetic radiation into the deeper parts of the wood material.

Measurement of colour changes

With device COLOR reader CR-10 was measured the colour. Values have been recorded before entering into Xenontestu and then in a weekly cycle at the completion of one part of the test. To the determination of hue and lightness are used CIE LAB - $L^*a^*b^*$ colour coordinate system according to ISO 7724 CIE Lab system. It was found that a small change in colour or colour stability of the coating exists when $\Delta E^* \leq 2$, the apparent colour change ΔE^* at 2 to 12, while $\Delta E^* > 12$ colour changes are very pronounced.

Results and discussion

In the Table 2 we can see the colour changes of wood surface treatments on pine. Positive values (plus) indicate increase Δb yellow and negative values shift to the colour blue. Positive values indicate a tendency Δa wood finishing move your colour under the trichromatic coordinates toward reddish tones, while negative values show a shift to green tones. The results show that the greatest shift the coordinate Δa for pine (*Pinus L.*) painted brown coating exhibits comp PB1, and the initial value of this sample was $a^* = +15.1$ at time T0 and after accelerated aging showed a a^* value = -8,1 at time T2. Here, the colour shifted from red to green tones (Fig.5). The largest shift of value Δb for the sample PB1 with a brown colour, where $\Delta b = 7,1$ and the colour shifted from blue to yellow shade. The smallest was for the sample PB11 where $\Delta b = 0,1$ and the colour has not changed significantly. Similar values we have noted with the samples painted with green colour. The largest value of ΔL , thus brighter colour of sample, exhibits PB2 sample (two layer painted sample) which is $\Delta L = 5,6$. In this case, the colour shifted to the brighter shade. The smallest value $\Delta L = -1,0$ (darkening of the sample) of the sample PG10 coated with two coats, but in this case with sanding applied between the coats. The results show that the samples that were treated by sanding before they were coated a colour fastness occurs. For samples that were not treated before coating the surface, it occurs in dependence on time for colour fading. Among samples PB1-3 and PG1-3 are ΔL values greater than in the samples PB9-11 and PG9-11 which were sanded with sandpaper.

Table 2. Difference values of L^* , a^* , b^* at time T0 and T2 for pine wood with brown colour

Colour	Brown											
Time	T0						T2					
Label	PB1	PB2	PB3	PB9	PB10	PB11	PB1	PB2	PB3	PB9	PB10	PB11
L^*	40.7	28.7	27.6	29.6	26.3	26.4	42.2	34.2	32.3	29.1	27.4	27.3
a^*	15.1	5.1	1.6	5.1	2.2	1.9	5.0	0.9	0.7	5.0	1.6	1.6
b^*	7.9	3.2	1.1	5.7	4.1	1.2	15.0	8.1	3.5	6.1	4.3	1.3

Table 3. Difference values of L^* , a^* , b^* at time T0 and T2 for pine wood with green colour

Colour	Green											
Time	T0						T2					
Label	PG1	PG2	PG3	PG9	PG10	PG11	PG1	PG2	PG3	PG9	PG10	PG11
L^*	36.8	32.9	30.0	40.0	32.7	28.9	40.0	35.6	32.2	39.3	31.7	28.2
a^*	-8.1	-7.7	-7.3	-7.7	-7.9	-5.3	-7.0	-6.8	-5.2	-7.5	-7.5	-5.2
b^*	10.7	6.3	2.7	15.2	8.0	4.0	14.3	7.5	3.4	16.2	7.5	2.9

Fig. 1 Variability and the shift of the colour space ΔL , Δa , Δb in time T0 as well as ageing pine wood samples in time T2. The value ΔL closer to zero means darkening of colours.

Due to the two-week exposure in aging accelerators darkened colour most of the samples labelled PB2, i.e. for samples, which were selected in the impregnating finish without sanding individual layers. The smallest change in colour exhibited samples PB9 where $\Delta L = -0.5$ and PG11 $\Delta L = -0.7$. Where is surface before applying the finishing roughened, and the interlayer brushing. The samples of pine, green colour darkened with time, while the brown brightness. It has been shown that certain types of finishes may darken first, before it lightens, which describe Hon (1973), and this would explain the darkening of brown colour-paint. A prerequisite would be that a longer period of time when exposed to the samples in the Xenotest chamber occurred lightening.

Table 4. Colour changes of pine wood exposed to accelerated weathering test. Minuz before the number ΔL indicates darkening.

Pine	Brown						Green					
Label	PB1	PB2	PB3	PB9	PB10	PB11	PG1	PG2	PG3	PG9	PG10	PG11
ΔL	1.5	5.6	4.7	-0.5	1.1	0.9	3.4	2.8	2.2	-0.8	-1.0	-0.7
Δa	-10.1	-4.2	-1.0	-0.2	-0.6	-0.3	1.1	0.9	2.1	0.2	0.4	0.1
Δb	7.1	4.9	2.4	0.4	0.2	0.1	3.7	1.2	0.7	0.9	-0.5	-1.1
ΔE	12.4	8.5	5.4	0.7	1.3	0.9	5.1	3.1	3.1	1.2	1.2	1.3

Conclusion

The results of exposure to artificial weathering showed that the colour stability, evaluated according to the CIE L^* a^* b^* system under evaluation ΔL^* , Δa^* , Δb^* and ΔE^* was better at the samples, which were grinded between coatings. In combination of distortion wood grinding before and after deposition of stains would explain the increased transfer of moisture and thus the leaching of colour pigments. In this experiment, we confirmed that each coating behaves differently in different types of wood. The fewer layers applied on the wood surface, the more we can expect loss of colour. Influence on changes surface and ageing of wood surface, have not just the kind of wood, but the whole conditions and way of finish. With a good surface finish it is possible to prolong durability of wooden facade systems. During the process of choosing wooden facade it is necessary to focus on right choice of wood and regular wood protection. We must adopt fact that ageing is natural, and is impossible to avoid them, but we can eliminate the bad results of natural aging paint finish right.

Acknowledgement

The paper was realized with the financial support of the Ministry of Education, supporting specific academic research - Student Grant Competition VSB-TU Ostrava under the identification number SP2014/94 - Experimental analysis of wood with impregnation glaze and detection of degradation of wood being placed in ageing accelerator.
