<b>1 Drivers for the Adoption of Multi-service Networks</b>	<b>1</b>
1.1 Customer Perspective	2
1.2 Network Operator Perspective	4
1.3 Service Provider Perspective	6
1.4 Summary	7
<b>2 Service Quality Requirements</b>	<b>9</b>
2.1 Services on the Internet	12
2.2 Definition of a Service	16
2.2.1 End user service versus provider-level services	18
2.2.2 About service instances and service events	20
2.2.3 Reference model for this section	22
2.3 Service Quality Estimation	23
2.3.1 Measures of end user experienced service quality	24
2.3.2 Recency effect	26
2.3.3 Psychological factors	27
2.3.4 Summary	28
2.4 Service Implementation Aspects	28
2.4.1 Choice of transport protocols	28
2.4.2 Throughput adaptability of services	29
2.5 Inherent Service Quality Requirements	30
2.5.1 Service quality characterizations in standards	30
2.5.2 Availability of service	33

2.5.3 Continuity of service	34
2.5.4 Delivery time end-to-end	35
2.5.5 Throughput	38
2.5.6 Support for continuous service data unit transmission	39
2.5.7 Reliability of service delivery	42
2.5.8 Support for variable transfer rate	44
2.5.9 Generic considerations related to service requirements	45
2.6 Service Quality Descriptors	47
2.6.1 Measurement-based determination of traffic profile	49
2.7 Summary	50
<b>3 Network Mechanisms for Multi-service Quality Support</b>	<b>53</b>
3.1 Introduction to Network Quality Support	54
3.2 Policing of Traffic at Ingress	58
3.3 About Layers	61
3.4 Types of Network Support for Service Quality	62
3.4.1 Capacity reservation	64
3.4.2 Differentiated treatment	65
3.4.3 Differentiation of service quality instantiation	67
3.4.4 Summary of generic network service quality support mechanisms	68
3.5 Service Support in ATM	69
3.5.1 ATM service models	70
3.5.2 Summary of ATM service support	70
3.6 Service Support Models in Internet Protocol	71
3.6.1 Best effort service model	72
3.6.2 Controlled-load service support	74
3.6.3 Guaranteed QoS support	75
3.6.4 RSVP	76
3.6.5 Statistical QoS: DiffServ model	77
3.6.5.1 EF PHB	79
3.6.5.2 AF PHB group	81
3.6.5.3 Other PHBs	82
3.6.5.4 Functions of a DiffServ router	82
3.6.5.5 Summary of DiffServ	83
3.6.6 Summary of IP QoS service models	83
3.7 Routing in IP Networks	85
3.7.1 On addressing	86
3.7.2 IP routing protocol-based methods	87
3.7.3 ATM overlays	88
3.7.4 Lower layer tunnels: MPLS	89
3.8 Link Layer Issues	90
3.8.1 Performance	92
3.8.2 A note on scheduling	93
3.9 Summary	94

<b>4 Traffic Engineering for Multi-service IP Networks</b>	<b>97</b>
4.1 Traffic Engineering	98
4.1.1 Context of traffic engineering	100
4.1.2 The traffic engineering process	102
4.1.3 Obtaining performance data from the network and analysing it	104
4.1.3.1 Traffic aggregate performance measurements	105
4.1.3.2 Obtaining data relevant for routing control	110
4.1.4 Performance enhancement	113
4.1.5 Scope of network optimization	116
4.2 IP Routing Control and Traffic Engineering	117
4.2.1 Optimizing routing based on service quality characteristics	119
4.2.2 Traffic engineering using MPLS	120
4.2.2.1 DiffServ over MPLS	121
4.2.3 Traffic engineering using IP routing protocols	123
4.2.4 Summary	124
4.3 Configuration	125
4.3.1 Policy-based management	126
4.3.2 Policy-based management of DiffServ	129
4.3.2.1 Case study of policy-based management of DiffServ	130
4.4 Summary	132
 <b>5 Mapping Service Requirements to Network Resources</b>	 <b>133</b>
5.1 Scope of this Chapter	135
5.2 ETSI EP TIPHON Reference Model	137
5.2.1 Architecture	137
5.2.2 QoS model	140
5.2.3 Summary	141
5.3 QBONE	142
5.3.1 Service support models	143
5.3.2 Summary	144
5.4 3GPP QoS Model	145
5.4.1 QoS model	146
5.4.2 Summary	148
5.5 Other Models	148
5.6 Utility-based Allocation of Resources	149
5.6.1 Summary	152
5.7 Generic Resource Allocation Framework	152
5.7.1 Signalling	154
5.7.2 Mapping of services onto network resources	156
5.7.3 Network quality support configuration for DiffServ	160
5.7.4 End-to-end service quality budgets	163

5.7.4.1 Delay	164
5.7.4.2 Delay variation	168
5.7.4.3 Packet loss rate	171
5.7.4.4 Packet loss correlation	172
5.7.4.5 Throughput	173
5.7.5 Optimization of resource allocation	174
5.8 Summary	176
<b>6 Service Level Management Techniques</b>	<b>179</b>
6.1 Models for Service Level Management	179
6.1.1 Areas of service level management	180
6.1.2 Layers of service level management	181
6.1.3 Models for managed data	183
6.2 Service Planning and Creation Process	184
6.2.1 Interests of the customer	184
6.2.2 Network operator viewpoint	187
6.2.3 Service definition	188
6.2.4 Reporting	190
6.3 Service Level Agreements	191
6.3.1 SLA and DiffServ	193
6.3.2 SLA contents	196
6.3.3 End user SLAs	197
6.4 End-to-end Services	198
6.4.1 Assumptions about connection endpoints	200
6.4.2 Assumptions about per-domain service management	204
6.4.3 Requirements for end-to-end service management	206
6.5 Service Brokers and Charging	207
6.6 Summary	209
<b>7 Measurements</b>	<b>211</b>
7.1 Traffic Characterization	213
7.2 Network Monitoring	216
7.2.1 Troubleshooting measurements for services	217
7.3 Traffic Control	219
7.4 Definition of Measured Characteristics	220
7.5 Sources of Measurement Data	222
7.5.1 Measurement interfaces	222
7.5.2 Measured characteristics	223
7.6 Measurement Methods	225
7.6.1 Obtaining performance data from network elements	225

# Preface

Development of packet-switched data communication networking technologies has been rapid in recent years, a phenomenon made possible by the open standardization process and the potential new territories for intellectual property creation. As a consequence, new ways of creating services have been devised, bringing more flexibility as compared to traditional telecommunications schemes. Such possibilities bring certain consequences with them – since services as such are no longer necessarily standardized and can be created rapidly, tailoring them to different access technologies is less feasible. New service creation models also allow for the existence of sole service providers making use of separate network transport operators' facilities. Interworking of different players of end-to-end service delivery requires advanced Service Level Agreement (SLA) handling capabilities between the parties involved.

This brings us to another major theme of this book, namely that of building a platform for converged service access. Internet Protocol (IP) has emerged as a tried-and-tested unifying end-to-end communication layer that can be run over multiple link layer technologies. Subsequently, using IP networks as a basis for providing end-to-end services makes perfect sense. The challenge to present-day IP networks comes from advanced real-time services such as streaming and voice/video conferencing, which are demanding applications from the viewpoint of network technology. This book addresses the service quality support technologies needed to deliver different types of content over IP network.

The economic environment of network operators has changed in the past years, becoming a very competitive business area. Price

competition among players is at worst fierce, leading to the target of reduced operating costs for production networks. At the same time, the network operator must be able to provide service quality support to new services with as short time-to-market delays as possible. This situation calls for advanced management techniques and models for managing the resources of the multi-service network as effectively as possible.

A set of technologies and techniques known as traffic engineering addresses this need, providing for processes and frameworks to accommodate performance management of a network. The technologies belonging to this area, including measurements, multi-protocol label switching, and routing control in general, complement the capabilities of the IP protocol suite. The new, open Internet standardization process defines effective and scalable means of configuring the novel protocols complementing IP as the building blocks of multi-service networks. An example of such endeavours is the policy-based management work, bringing automated network configuration and management while at the same time raising the abstraction level of management.

In the chapters that follow, the steps needed to be taken to create and manage services in a multi-service IP network are presented. The vision of multi-service, multi-access networks with flexible service creation is presented first. A framework is developed for describing service quality, and the generic steps of service creation to service level specification are covered. The protocol tools available for managing service quality in IP environment are described within a service support framework. The managed technologies considered in this book include Internet Protocol versions 4 and 6 and Differentiated Services (DiffServ). The statistical service quality support model of DiffServ is compared with Integrated Services (IntServ) and Asynchronous Transfer Mode (ATM). Advanced IP service quality management techniques such as Multi-Protocol Label Switching (MPLS) and policy-based management are covered. Finally, the role of measurements and Service Level Agreements (SLAs) within the framework is described, and novel ideas such as the use of bandwidth broker and utility-based allocation of resources are discussed.

The approach of this book could perhaps be best described as a system level solution viewpoint, not going very deep into individual technologies while attempting to provide an overview of the relevant technologies.

This book represents the author's attempt to best capture the multi-faceted area of service quality in IP environment of today. Due to commercial factors and novel innovations, the reader is strongly encouraged to take heed of J.W. Goethe's advice:

Gray, my friend, is all theory;  
Green only the tree of life.

## ORGANIZATION OF MATERIAL IN THIS BOOK

Chapter 1 describes the technological and business scenario for multi-service networks. Chapter 2 describes the service quality requirements of IP service types in the network. Chapter 3 describes service quality support mechanisms that can be used in an IP-based access or transit network. Chapter 4 describes how traffic engineering processes can be used in optimizing the performance of a multi-service IP network domain, and technologies that can be used by policy management. Chapter 5 describes how services can be mapped to network resources in an IP domain as a part of an end-to-end service quality support chain. Chapter 6 describes technologies for service quality management and service level agreements (SLAs). Chapter 7 describes measurement technologies that can be used by service management and traffic engineering processes. Chapter 8 describes means of managing dynamic service quality within a DiffServ domain, and between Internet domains in general. Chapter 9 describes the implementation of service quality in IP RAN as a case study of the technologies discussed in the book. Chapter 10 summarizes the central themes of the book, and discusses potential emerging technologies relevant to the topic of the book.

Major interdependencies between chapters with respect to each other are illustrated by the matrix below.
