Contents

Contributors, viii

Foreword, ix

Abbreviations, xi

Introduction, xiii

Part 1

Section 1: Errors and their causes

A few words about error, 1

Learning from system failures – the vincristine case, 1

Person-centred paediatric errors and their causes, 8

The patient consultation, 10

Failure to identify a sick child, 12

Inability to perform practical procedures competently, 13

Failure to check test results or act on abnormal findings, 15

Prescribing errors, 16

Failures in resuscitation, 17

Sources of error in child protection cases, 19

References and further reading, 22

Section 2: Medico-legal aspects

Error in a legal context, 25

Negligence, 25

Medical negligence, 26

Issues around consent, 29

Confidentiality, 34

References and further reading, 37

Part 2 Clinical cases

Introduction, 39

Case 1 A boy with a limp, 40

Case 2 A fitting infant, 43

- Case 3** A persistent fever, 45
- Case 4** A biking injury, 48
- Case 5** A teenager with abdominal pain, 51
- Case 6** A young girl with a vaginal discharge, 54
- Case 7** An iatrogenic problem, 57
- Case 8** An infant with a large head, 59
- Case 9** An infant with bloody diarrhoea, 62
- Case 10** An infant with persistent jaundice, 64
- Case 11** A child with leukaemia and tummy ache, 66
- Case 12** A boy with fever and rigors, 68
- Case 13** A stiff hand, 70
- Case 14** A serious feeding problem, 72
- Case 15** Fits, faints and funny turns, 74
- Case 16** A hospital acquired infection, 76
- Case 17** Recurrent wheeze, 79
- Case 18** A jaundiced neonate, 82
- Case 19** A febrile boy with a limp, 85
- Case 20** A febrile neonate, 87
- Case 21** A neonate with abnormal movements, 89
- Case 22** A teenager with scrotal pain, 91
- Case 23** A boy with nonspecific symptoms, 93
- Case 24** A delayed walker, 96
- Case 25** A diabetic girl with a headache, 98
- Case 26** A boy with sickle cell disease and a fever, 101
- Case 27** Negative test results, 104
- Case 28** A bad case of 'flu, 107
- Case 29** A difficult transfer, 110
- Case 30** Treatment for tonsillitis, 112
- Case 31** Increasing respiratory distress, 114
- Case 32** A feverish girl with poor feeding, 116
- Case 33** An infant with a swollen face, 118
- Case 34** Starting a new treatment, 121
- Case 35** The importance of interpretation, 124
- Case 36** A febrile boy with a scald, 126

Part 3 Investigating and dealing with errors

- 1** Introduction, 129
- 2** How hospitals try to prevent errors and their recurrence, 129
- 3** The role of hospital staff, 134
- 4** External investigators, 136
- 5** Hospital investigations, 138
- 6** Legal advice – where to get it and how to pay, 143
- 7** External inquiries, 146
- 8** The role of the doctor, 165
- 9** Emotional repercussions, 167
- 10** Conclusion, 169

References and further reading, 169

Index, 171

Contributors

Heather Mackinnon

Consultant Paediatrician
Whittington Hospital
London

Part 1, Section 1: Sources of Error in Child Protection

Cases: 6, 23, 33

Gopa Sen

Locum Consultant Paediatrician
Whittington Hospital
London

Case 8

Section 3: How Hospitals Try to Prevent Errors and Their Recurrence

Joanna Walker

Consultant Paediatrician
Portsmouth Hospital NHS Trust
Portsmouth

Cases: 11, 15, 17, 25, 30, 31,

Acknowledgements

The authors would like to thank Dr Nick Owen, Consultant Radiologist, Whittington Hospital; Dr Tony Wheeler, Consultant Community Paediatrician, Whittington Hospital; and Dianna Scarrott, Head of Information and Knowledge Management, National Clinical Assessment Service, National Patient Safety Agency for their help and advice with different sections of the book.

Foreword

Sometimes we may learn more from a man's errors, than from his virtues.

—*Henry Wadsworth Longfellow*

Paediatrics is an exciting, rewarding and diverse speciality. Doctors who opt for a career in paediatrics know that the high intensity, challenging aspects of the work are balanced in equal measure by the satisfaction of supporting children and families through both acute and long-term illness. However, every practising clinician lives with the uncomfortable truth that the practice of medicine is an error-prone business; and if the stakes are high in all specialities, they are even more so in the care of children.

It goes without saying that no doctor or nurse leaves home in the morning with the intention of harming a child. Indeed, we can only function in the workplace by putting to the furthest recesses of our mind the notion that our actions, in the worst-case scenario, could result in a child's death. Nonetheless, the guilt and self-recrimination that follow even the most trivial of errors are emotions that every clinician would wish to avoid. And that is the great appeal of this book. It is not an academic treatise on the extensive literature about error, human factors, system failure and organizational accidents. Because the busiest, most hard-pressed paediatrician – arguably at greatest risk of making an error – is the one least likely to read such a book. Rather this is an accessible and engaging book, written in a way that will draw its readers in through the appeal of case studies.

For those who do want a helicopter overview of the key causes of errors and the legal context, that is provided in a short punchy style in the first section of the book. The systematic reader will start there first, whilst those who take more of a 'bumble-bee' approach to flitting around books will fly straight to the cases studies. These cannot be read passively! They are devised so as to challenge as well as inform, forcing the reader to really think through what they would have done in the circumstances, before presenting the expert opinion and legal comment, and rounding up with key learning points. Each one can be read in a few minutes at a bus stop or in a lull between patients in a clinic – and any one could make the difference between a clinician making or averting the same mistake. The final section wraps up with a practical account of investigation and management of errors and their fallout.

Every serious paediatric error is a tragedy for the child and family involved. Perhaps the greatest tragedy of all, as set out at the beginning of this book, is that errors fall into recurrent themes that are repeated by successive generations of doctors. Families of children who have suffered from a medical error

frequently say that they don't want the same thing to ever happen to another child. This book is the most effective way to widely share learning from the case studies, and in doing so to give something back – albeit anonymously – to the children and families involved. If each case described stops even one similar recurrence it will be a worthwhile outcome.

Hilary Cass
President, Royal College of Paediatrics and Child Health

		ZIG	zoster immune globulin

Introduction

In 2000, a committee established by the Department of Health, chaired by the then Chief Medical Officer, Professor Liam Donaldson, published its report *An Organisation with a Memory*. The report recognized that the vast majority of NHS care was of a very high clinical standard and that serious failures were uncommon given the volume of care provided. However, when failures do occur their consequences can be devastating for the individual patients and their families. The health care workers feel guilt and distress. Like a ripple effect, the mistakes also undermine the public's confidence in the Health Service. Last, but not least, these adverse events have a huge cumulative financial effect. Updating the figures provided in the report, in 2010/11, the NHS Litigation Authority (the NHSLA is the body that handles negligence claims against NHS Trusts in England) paid out £863,400,000 for medical negligence claims (these figures take no account of the costs incurred by the Medical Defence Organisations for General Practice and private health care). The report commented ruefully that often these failures have a familiar ring to them; many could be avoided 'if only the lessons of experience were properly learned'.

The Committee writing the report also noted that there is a vast reservoir of clinical data from negligence claims that remains untapped. They were gently critical of the Health Service as being par excellence a passive learning organization; like a school teacher writing an end of term report, they classified the NHS a poor learner – could do better. On a more positive note, the report stated that 'There is significant potential to extract valuable learning by focusing, specialty by specialty, on the main areas of practice that have resulted in litigation.' It acknowledged that learning from adverse clinical events is a key component of clinical governance and is an important component in delivering the Government's quality agenda for the NHS.

The NHSLA has reported that its present (as of 2011) estimate for all potential liabilities, existing and expected claims, is £16.8 billion. At the time *An Organisation with a Memory* was written, this figure stood at £2.4 billion. (These sums are actuarially calculated figures that are based on both known and as yet unknown claims, some of which may not surface for many years to come. They should not be confused with the figure of £863,000,000 mentioned above, which was the sum actually paid out in one year.) The NHSLA also reported that the number of negligence claims rose from 6652 in 2009/10 to 8655 in 2010/11. While the increases in these figures may be due to the increased readiness of patients to pursue negligence claims and the very significant costs of claims inflation, rather than any marked decline in the standard of care provided by the NHS, the statistics clearly show
